

DATALINKNOTIFY system variable

1397 GstarCAD MY /KW July 9, 2021 [System Variables](#) 0 2335

Function Description:

The **DATALINKNOTIFY** system variable is used to control the notify about updating or missing data links.

Type : Integer

Saved in : Registry

Initial value : 2

Range : 0,1,2

System Variable Value:

0 : forbid updating data link notification

1 : enable data link notification. Notifies users that external data is linked to the current drawing by displaying the data link icon in the lower-right corner of the application window (the notification area of the status bar tray). It will not display balloon message notifications.

2 : enable data link notify and balloon message notifications. Notifies users that external data is linked to the current drawing by displaying the data link icon in the lower-right corner of the application window (the notification area of the status bar tray). It also displays a data link file change notification in the area of the drawing where the data link requires updating.
