

-GROUP command

2141 GstarCAD MY /KW August 16, 2021 [CAD Commands](#) 0 1049

The **-GROUP** command is used to create and manage the saved object group.

Command Access:

Command : -GROUP

Command Prompts:

Enter group option [?/Order/Add/Remove/Explode/REName/Selectable/Create] :

Relative Glossary:

?:

List names and descriptions of groups defined in the drawing.

Order:

Change the numerical order of objects in the group.

Reorder:

Users could specify the position number of objects to recorder all members in the group.

Reverse order:

reverse the order of all members in the group.

Add:

Add objects to a group.

Remove:

Remove objects from a group. The group definition still exist even if all objects in group removed. They could be removed by Explode option.

Explode:

Explode the group into its component objects to delete a group definition.

Rename:

Assign a new name to an existing group.

Selectable:

Specify whether a group is selectable. When it is selectable, selecting one object in the group selects the whole group. Objects on locked or frozen layers are not selected.

Create:

Create a group. Group names could contain letters, numbers, and special characters such as dollar sign (\$), hyphen(-), and underscore(_) but spaces. The name of a group is up to 31 characters long and they will be converted to uppercase characters.
