-GROUP command

2141 GstarCAD MY /KW August 16, 2021 [CAD Commands](#) 0 1083

The -**GROUP** command is used to create and manage the saved object group.

Command Access:

Command : -GROUP

Command Prompts:

Enter group option [?/Order/Add/Remove/Explode/REName/Selectable/Create] :

Relative Glossary:

?:
List names and descriptions of groups defined in the drawing.
Order:
Change the numerical order of objects in the group.

Reorder:
Users could specify the position number of objects to recorder all members in the group.
Reverse order:
reverse the order of all members in the group.

Add:
Add objects to a group.
Remove:
Remove objects from a group. The group definition still exist even if all objects in group removed. They could be removed by Explode option.
Explode:
Explode the group into its component objects to delete a group definition.
Rename:
Assign a new name to an existing group.
Selectable:
Specify whether a group is selectable. When it is selectable, selecting one object in the group selects the whole group. Objects on locked or frozen layers are not selected.
Create:
Create a group. Group names could contain letters, numbers, and special characters such as dollar sign ($), hyphen(-), and underscore(_) but spaces. The name of a group is up to 31 characters long and they will be converted to uppercase characters.
