

IMAGEQUALITY command

2158 GstarCAD MY /KW August 16, 2021 [CAD Commands](#) 0 1084

The **IMAGEQUALITY** command is used to control display quality of image.

Command Access:

Menu : Modify > Object > Image > Quality

Command : IMAGEQUALITY

Command Prompts:

Enter image quality setting [High/Draft] <High>:

Function Description:

The image quality settings will have effect on its performance. It will take a lot of time to display high quality image. It will immediately update without regeneration. Note: it always prints images with high equality settings.

Relative Glossary:

High:

Generate images with high quality.

Draft:

Generate images with much lower quality.

The image quality setting affects display performance. High-quality images take longer to display. Images are always plotted by a high-quality setting.
