

LAYERP command

2176 GstarCAD MY /KW August 17, 2021 [CAD Commands](#) 0 1174

The **LAYERP** command is used to quit last change or last group of changes of layer settings.

Command Access:

Ribbon : Home > Layer > LAYERP

Menu : Format > Layer Tools > Layer Previous

Command : LAYERP

Command Prompts:

Restored previous layer status. Regenerating model.

Function Description:

Users could quit previous changes of layers settings (such as color or line weight) and display "Restored previous layer status" in the command prompt by this command. All changes of layers are traced. Users could use this command to quit changes by "Layer" controls or layer properties manager.

The LAYERP command could not quit some changes as following:

Layers renamed:

If the layer name and its properties are changed, the LAYERP command could restore layer properties rather than its name.

Layers deleted:

If the layer has been deleted or cleared up, the LAYERP command could not restore it.

Layers added:

If users add a new layer, the LAYERP command could not delete it.
