

MODEL command

2240 GstarCAD MY /KW August 19, 2021 [CAD Commands](#) 0 795

The **MODEL** command is used to switch from paper space to model space.

Command Access:

Command : MODEL

Function Description:

User could create a drawing in model space. By default, the TILEMODE system variable is specified to 1 and user could create model viewports to display various kinds of views. When finishing drawing, users could select one layout to set printing style. Users could switch among layouts or from model to named layouts and enhance performance by specifying the LAYOUTREGENCTL system variable to control the update list.
