MSLIDE command

2244 GstarCAD MY /KW August 19, 2021 [CAD Commands](#)   0 985

The **MSLIDE** command is used create a slide for current model or layout.

Command Access:

Command : MSLIDE

Function Description:

Users could input a slide name or select a slide the "Create Slide File" dialog box. The slide file is raster graph of layout. In the model space, the MSLIDE command could create a slide of current layout; in layout space, it could create a slide of drawing space containing all viewports with their contents.
The slide file could not contain the graph beyond screen and layers turned off or frozen.
Users could use the VSLIDE command to view slides. Make the slide colored by the SHADE command. If the viewport that used to color it is much bigger than that created, or the coloring resolution is higher than that created, users may find some black lines distributed sporadically in colored drawing when viewing it. In order to avoid this situation, please set the resolution to the highest of full screen when creating slide files.
