# Draw Multilines

2502 GstarCAD MY /KW November 9, 2021 [Workflow](#) 0 821

Multiline objects are created by using the [MLINE](#) command. A multiline is composed of 1-16 parallel lines (two lines by default).

The STANDARD style for drawing a multiline has two elements. You can create new styles and modify their definition by [MLSTYLE](#) . You can specify quantity of lines ([LINE](#)), [OFFSET](#) , [COLOR](#) , linetype ([LINETYPE](#)) and so on.

Create and Edit Multiline Styles

If you have many styles, select one style as current style before drawing multiline. You can also specify the justification and scale of multiline.

You can open Multline edit tools by [MLEDIT](#) or double click the mline.
