

Modify Polylines

2551 GstarCAD MY /KW November 9, 2021 [Workflow](#) 0 711

To change the shape of polyline ([PLINE](#)) objects or to join separate polylines, you can access editing operations of [PEDIT](#).

Polylines can be edited by closing and opening them, or moving, adding and deleting vertices.

Joined Polyline Segments

If a [LINE](#), an [ARC](#), or a polyline connect to an open polyline at their ends, you can join them. You can also join ends, which are not coincident but are within a settable distance.

Properties of Modified Polylines

If the joined objects had different properties, the first selected object will determine the properties of the resulting polyline.

Additional Editing Options for Polylines

PEDIT offers extra options for editing and joining polylines, besides the common editing operations, which are accessible for most objects:

[Close/Join/Width/Edit vertex/Fit/Spline/Decurve/Ltype gen/Reverse/Undo]
